DETAILED ACTION

Election/Restrictions

1. Applicant's election with traverse of Group I is acknowledged. No argument was presented so the requirement restriction is maintained.

The requirement is still deemed proper and is therefore made FINAL.

Claims 14-26 are withdrawn from further consideration pursuant to 37 CFR 1.142(b), as being drawn to a nonelected invention, there being no allowable generic or linking claim. Applicant timely traversed the restriction (election) requirement. Pending claims to be examined are claims 1-13.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chow et al (US5,965,410 Oct. 12, 1999).

Chow et al teach a method of identifying and detecting nucleic acids in a device with both pH and temperature gradients (see whole doc.). They teach the crosssectional variations in the channels upon which voltage gradients are translated create temperature and proton gradients

Art Unit: 1637

(see col. 15 lin 10-30 & col. 8 line 46-55). They teach the denaturation and renaturation of DNA with detection on intercalating dye (see example 1).

They do not explicitly teach detecting rate of binding.

One of ordinary skill in the art would have been motivated to measure binding in Chow et al's device in order to monitor the product in real time. It was well known and commonly practiced in the art to monitor the reaction product with intercalating dyes. It would have been prima facie obvious to monitor the binding of DNA in Chow et al's pH and temperature gradient device in order to detect reaction kinetics.

SUMMARY

3. No claims allowed.
